

Account Security & Two-Factor Authentication (2FA) Guide

CloudSuite Knowledge Base — Security & Access

Overview

This guide explains how to enable, manage, and recover Two-Factor Authentication (2FA) on your CloudSuite account, along with general account security best practices.

Setting Up 2FA

CloudSuite supports authenticator-app based 2FA (TOTP), compatible with Google Authenticator, Authy, and 1Password. SMS-based 2FA is not supported due to known security weaknesses in SMS delivery.

- Go to Settings > Security > Two-Factor Authentication
- Click "Enable 2FA" and scan the displayed QR code with your authenticator app
- Enter the 6-digit code generated by your app to confirm setup
- You will be shown 10 single-use backup codes — store these somewhere safe outside your authenticator app

Backup Codes

Backup codes allow login if you lose access to your authenticator device. Each code can only be used once. If you use your last backup code, CloudSuite will prompt you to generate a fresh set the next time you log in. We strongly recommend storing backup codes in a password manager rather than as a screenshot or plain text file.

Lost Access to Authenticator Device

If you lose your authenticator device and have no remaining backup codes, self-service recovery is not possible — this is an intentional security restriction to prevent account takeover. You must contact support and provide proof of account ownership, such as:

- A billing receipt or invoice tied to the account
- Verification of the domain associated with a workspace (for Admin/Owner accounts)
- Confirmation of recent account activity that only the account holder would know

Manual 2FA resets are processed within 1-2 business days after identity verification is complete. This cannot be expedited through standard support channels for security reasons.

Enforcing 2FA Workspace-Wide

Admins and Owners can require 2FA for all workspace members under Settings > Security > Enforce 2FA. Once enabled, members without 2FA configured will be prompted to set it up on their next login and

will have limited access until they do so.

Session Management

You can view and revoke active sessions under Settings > Security > Active Sessions. Revoking a session immediately logs that device out, regardless of whether it currently has 2FA or password-based authentication active. We recommend reviewing active sessions periodically, especially after changing your password.

Suspicious Login Alerts

CloudSuite automatically emails account owners when a login occurs from a new device or unfamiliar location. These alerts include an option to immediately revoke the session and force a password reset if the login was not authorized.
